

08/02/03

From the Design Team,

We are excited and proud of our newest and greatest offering, Doc-N-Load Desktop!

Doc-N-Load is specifically designed with the one end user problem that has never truly been dealt with, file management. End users of technology at one point or another have spent way too much time that would have otherwise been productive, searching for their files. I am sure, that even if you think on this yourself, you can remember the times that you just could not find that Word document, Excel file, PowerPoint presentation, or other document.

Even companies with a primary application that they use for running their business, uses additional programs like Microsoft Office, to facilitate needs not addressed by their primary application. Granted, there are some end users out there that have made their own folder structure or some other creative method of knowing where their files are, but they still have to keep that “scheme” of saving their files in mind, when they go to retrieve one. They navigate thru their special structures and tricks they only know, as they attempt to have control over their documents and files. This process, aside from wasting time, does not facilitate the retrieval and usage of those files by anyone else but them.

There is something to be said for using the search feature in Windows, but that is just a further waste of time, if you can even figure it out, or know where to start searching from, or can even remember part of the filename you are searching for, then you can wait for Windows to locate the hopefully correct file for you. This is why Doc-N-Load was created, to provide an automatic system of file finding, storage, retrieval, and backup. Doc-N-Load does not care what you use for software, other than requiring Windows 98 or higher. You are free to use ANY word processor, spreadsheet, presentation, or any software that leaves you with a file to save, that you will need to recall later. However, Doc-N-Load does not stop there. It includes features for automatically scanning in and viewing any paper documents that you would like to work with paperless, and without caring what kind of scanning, picture taking, video recording, hardware, you may have. Doc-N-load is compliant with ANY twain source.

By keeping the organizational structure for saving your files, automatically, in the background, and associating them to a definable point, by the end user, Doc-N-Load facilitates individual as well as workgroup file creation, usage, sharing, and backup. All the end user has to decide on is their main focal point. In example, an organization that works with many clients, can create a single record for each client, and put EVERY file for that client, in their own unique record. This means that finding the images, documents, and files required for interaction with that client, is on one simple, easy to use, desktop, specifically created for that client. After Doc-N-Load is implemented, they can go to that client’s desktop record, and stay completely focused on that client, as they need to when dealing with the client.

Given that Doc-N-Load does not concern itself with the applications you use to service your industry, it works for almost every business model!

The only actual requirement for deciding if Doc-N-Load works for your business is to ask if you save files as a normal course of business. If the answer to that is yes, then Doc-N-Load is for you!

For those a little bit more knowledgeable in the IT world you have probably seen a few document managers, scan to files, or supposed office productivity suites. The problems with most of those are primarily total cost of ownership, and that they tend to save their files in a proprietary format, as well as requiring special hardware. Doc-N-Load has NONE of those restrictions. It costs less than \$200 per license, has no formats of its own, as it organizes the files for the programs YOU use, and works with any twain compliant source. So ask yourself first if you save any files whatsoever during the course of doing your job for your company, and if you do, then order Doc-N-Load Desktop today!

Sincerely,

The Design Team
